

Instructions for Mason Lock Box ® Maintenance EZ948

We recommend you maintain your Mason Lock Boxes ® minimum once every 12 month or more frequently if you are located in a dusty area. Use a spray such as Key Lube or LPS -1 or a dry Teflon lubricant on the cam lock. **DO NOT USE WD-40 as it will attract more dirt and dust.** Additionally, lightly spray or wipe onto and around the gasket a silicone paste to keep the gasket from freezing.

*If the lock does not open due to surface corrosion or grit, perform the following procedure.

1. Spray the lock cylinder generously with a good carburetor cleaner such as Gum Out, Poxytube or LPS-1. These products leave no residue and dissolve any grit that may be interfering with the moving parts of the lock.
2. Take the master key and work it in and out of the lock several times.
3. Spray the lock cylinder with a dry Teflon lubricant a second time.
